

Economics

Economics is the social science that explores the problem of relative scarcity and its implications for problems of resource allocation, economic stability, growth and distribution. Applied fields, including labor relations, financial economics, international economics, and environmental economics, focus on specific aspects of these broad concerns. In the applied areas, students become cognizant of the interaction between economics and related disciplines.

The objectives of the Economics program are to (a) provide the theoretic and quantitative tools necessary to understand the development, structure, and operation of the contemporary economy; (b) develop skill in using those tools to analyze economic problems and to critically assess proposed solutions; and (c) provide information and guidance as students explore career opportunities in economics and develop their own post-graduate plans.

Note: Career options include staff and training positions in the financial sector, other service industries, and manufacturing. Graduate study opportunities include economics, law, business, and related fields.

Program Learning Outcomes | Economics, B.S.

1. Develop Critical Thinking skills in relation to economics: Students will develop deductive reasoning skills and demonstrate knowledge of neoclassical methodology in which an economic agent is viewed as an optimizer subject to constraints. Students will demonstrate mastery of the theories of demand, cost, production, and labor/leisure decision making.

2. Develop Critical Understanding of Role of Money in Economy: Understand the determinants of the demand and supply for money and be able to evaluate the impact changes in the market for money have on the economy as a whole, and accomplish these objectives above using quantitative skills and graphical models of the macroeconomy.

These techniques include multiple regression, logistic regression, multi-dimensional scaling, regression trees, cluster analysis, survival analysis and basic time series analysis. This class will focus on learning both the theoretical background and application of these methods and discuss the ethical and contextual issues that surround the use of statistical analysis in environmental research. (Also offered under ENVR 3800.)
